### 1.INTRODUCTION

### 1.1 Project Overview

There are number of users who purchase products online and make payment through e-banking. There are e-banking website who ask user to provide sensitive data such as username, password or credit card details etc often for malicious reasons. This type of website is known as phishing website. In order to detect and predict e-banking phishing website, we proposed an intelligent, flexible and effective system and is based on using classification data mining algorithm. We implemented classification algorithm and technique to extracts the phishing data set criteria to classify their legitimacy. The e-banking phishing website can be detected based on some important characteristics like URL and Domain Identity, and security and encryption criteria in the final phishing rate. Once user makes transaction through online when he makes payment through e-banking website our system will use data mining algorithm to detect whether the e-banking website is phishing website or not.

### 1.2 Purpose

The purpose of web phishing detection is to safeguard online users from becoming victims of online fraud, divulging confidential information to an attacker among other effective users of phishing as an attacker's tool; phishing detection tools play a vital role in ensuring a secure online experience for users.

### 2. LITERATURE SURVEY

Phishing website is a recent problem, nevertheless due to its huge impact on the financial and on-line retailing sectors and since preventing such attacks is an important step towards defending against e-banking phishing website attacks, there are several promising approaches to this problem and a comprehensive collection of related works. In this section, we briefly survey existing antiphishing solutions and list of the related works. One approach is to stop phishing at the email level, since most current phishing attacks use broadcast email (spam) to lure victims to a phishing website.

Another approach is to use security tool bars. The phishing filter in IE7 is a tool bar approach with more features such as blocking the user's activity with a detected phishing site. Other approach is to visually differentiate the phishing sites from the spoofed legitimate sites. Dynamic Security Skins proposes to use a randomly generated visual hash to customize the browser window or web form elements to indicate the successfully authenticated sites. A fourth approach is two-factor authentication, which ensures that the user not only knows a secret but also presents a security token .

However, this approach is a server-side solution. Phishing can still happen at sites that do not support two-factor authentication. Sensitive information that is not related to a specific site, e.g., credit card information and SSN, cannot be protected by this approach either .

However, an automatic anti-phishing method is seldom reported. The typical technologies of anti phishing from the User Interface aspect are done. They proposed methods that need Web page creators to follow certain rules to create Web pages, either by adding dynamic skin to Web pages or adding sensitive information location attributes to HTML code. However, it is difficult to convince all Web page creators to follow the rules .

#### 2.1 EXISTING PROBLEM:

If we can detect the phishing Web sites in time, we then can block the sites and prevent phishing attacks. It's relatively easy to (manually) determine whether a site is a phishing site or not, but it's difficult to find those phishing sites out in time. Here we list two methods for phishing site detection.

#### 2.3 PROBLEM AND STATEMENT

Attackers will steal information related to transaction details by using malicious links or by using any software or by sending emails. We need to be alert and not allow installing or downloading any unnecessary software or should not click on any unnecessary links. Now-a-days banks are sending mail or SMS for every transaction made on online. We need not to share any personal details related to bank. Though it an advantage, we need to keep transaction detail safe by having stronger algorithms. There are many security risks associated with web services on the Internet, including phishing websites. Online shopping and payments are popular among users. Some websites request sensitive information from users, such as username s, passwords, and credit card numbers, often for malicious purposes. This type of website is known as a phishing website. A proper solution is needed to detect and prevent phishing websites.

### 3. IDEATION & PROPOSED SOLUTION

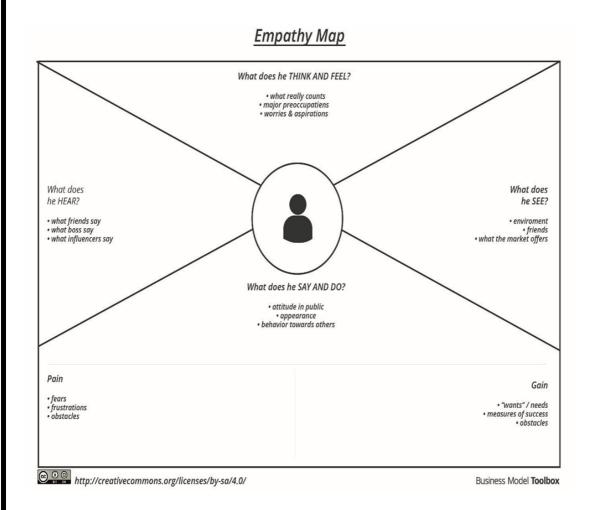

### 3.1 Empathy Map Canvas

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes. It is a useful tool to help steams better understand their users.

Creating an effective solution requires understanding the true problem and the person who is

experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

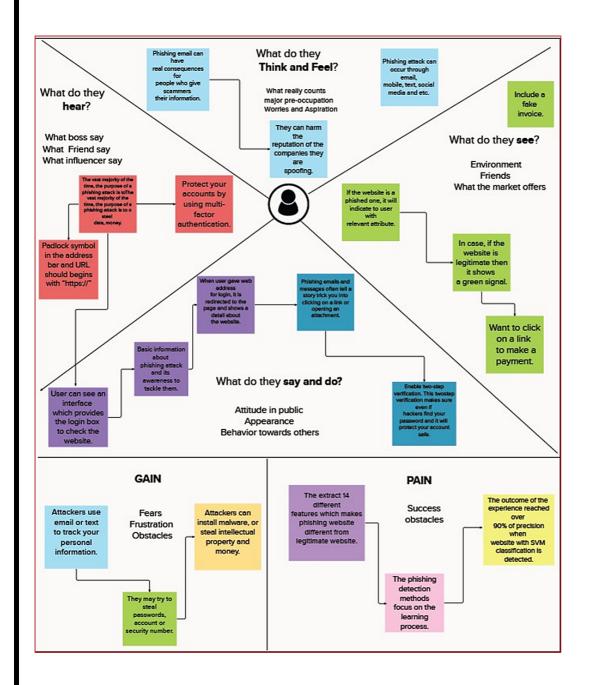

### **Example:**

### **Reference:**

Now-a-days banks are sending mail or SMS for every transaction made on online. We need not to share any personal details related to bank. Though it an advantage, we need to keep transaction detail safe by having stronger algorithms.

### 3.2 Ideation & Brainstorming

### **Brainstorm & Idea Prioritization Template:**

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

## 3.3 Proposed Solution

Sl.No	Parameter	Description

1.	Problem Statement (Problem to be solved)	<ol> <li>Data and Assets may be stolen ordamaged.</li> <li>Customers might be unable to access online services.</li> <li>Malicious statement steals the login credentials or financial information like credit card numbers.</li> </ol>
2.	Idea / Solution	Detection of malicious websites
	description	<ol> <li>To detect the web phishing websites for providing secured e-banking transactions, we proposed an intelligent and effective system based on classification machine learning algorithm.</li> </ol>
		3. Classification algorithms helps to identify the phishing datasets based on their authorized information like URL, Domain identity and encryption criteria.
		4. Once the user logs in to the e-banking websites, the proposed algorithm identifies the legitimate of the website and blocks the phishing site.

3.	Novelty /	1. The proposed classification algorithm helps to
	Uniqueness	identify the phishing site in an effective manner
		and blocks the site while avoiding the property
		damage forthe users
		2. Security alert
		3. The proposed model helps users to avoid
		getting trapped in different kindsof scams.
		4. Our model-will recognize fake vs real URLs
4.	Social Impact /	1. It will save the users from fraudulent websites
	Customer	and reduced global economical losses caused by
	Satisfaction	web phishing every year.
		2. It gives a reliable way to detect web
		phishing and scamming sites.
		3. It provides a secured and confidential
		environment for e-banking.
5.	Business Model	1. Our project can be used in e-commerce
	(Revenue Model)	and online e-banking transactions.
6.	Scalability of	1. It will be useful for a wide range of users from
	theSolution	individual users to corporate,banks and
		universities.
		2. Helps in reducing economical loss caused by
		these web phishing incidents and also protects
		from confidential.
		3. It identifies the suspicious phishing mails
		and enhances the security

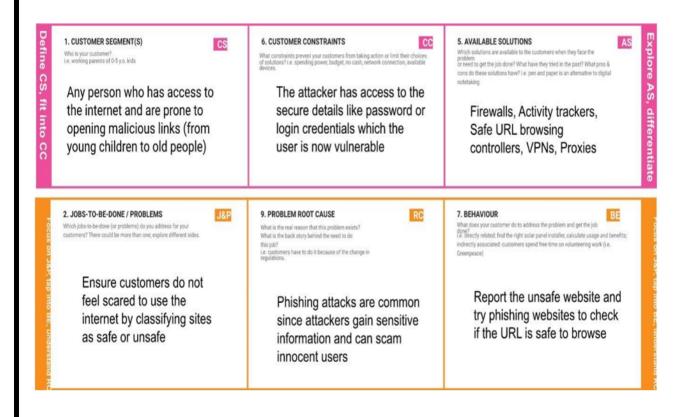

## 3.4 Proposed Solution Fit

The Problem-Solution Fit simply means that you have found a problem with your

customer and that the solution you have realized for it actually solves the customer's problem. It helps entrepreneurs, marketers and corporate innovators identify behavioural patterns and recognize what would work andwhy.

### **Purpose:**

Solve complex problems in a way that fits the state of your customers. Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behaviour. Sharpen your communication and marketing strategy with the right triggers and messaging. Increase touchpoints with your company by finding the right problem-behaviour fit and building trust by solving frequent annoyances, or urgent or costly problems. Understand the existing situation in order to improve it for your target group.

TR CH 3. TRIGGERS 10. YOUR SOLUTION 8. CHANNELS of BEHAVIOUR When customers see the The customer can use social media number of phishing attacks channels that they are familiar with to Develop a tool that can prevent the broadcast the issue with the malicious happening worldwide and to link and report these URLs through official channels like Google safe browsing or attackers from stealing the user data, people they know, they would and generates report, automated channels like Google safe browsing or be concerned about their data analysis and awareness training government officials etc. and would want to secure it. The customer can make use of our 4. EMOTIONS: BEFORE / AFTER solution to initially test out if the given link is malicious or not, based on which they can take action. Customers feel worried and frustrated when they face the problem but once they make use of our solution, customers will feel confident and secure about the links or data they are going to access. All of these activities take place online. Additionally, the model can be exported and run on local machines offline to perform the prediction

# **4.1 Functional Requirements**

FR	Functional Requirement(Epic)	Sub Requirement
No.		(Story / Sub-Task)
FR-1	Evaluate the dataset	download dataset
		and analyse
FR-2	Test and train thedataset	Use
		variousmode
		Is to testand
		train
		thedataset
FR-3	Get the bestmode	Model with most
		accuracy is selected
FR-4	It is implemented on awebsite	It findswhether a
		websiteis a
		phishing siteor
		not
FR-5	Enter Details aboutthe Yes/No in	
	all thefieldswebsite	
FR-6	Submit to get accuracy	After entering
		thedetails to get
		accuracy,
		Click on submit

# **4.2 Non-Functional Requirements**

NFR	Non-Functional Requirement(Epic)	Description
No.		

NFR-1	Usability	It is a websitewhich can be used in any platformto check whethera website is a phishingsite or not.
NFR-2	Security	It is highly secure as the details entered are contained within the website and it cannotbe accessed by others.
NFR-3	Reliability	The accuracyof the model can be brought up to morethan 90 percent.
NFR-4	Performance	Only one model is used to detect whetheror not a site is phishing, so it gives the result instantaneously after thedetails are enteredand it is submitted.
NFR-5	Availability	
NFR-6	Scalability	It is scalable to applications and other anti-virus software.

## 5. Project Design

## **5.1 Data Flow Diagrams**

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

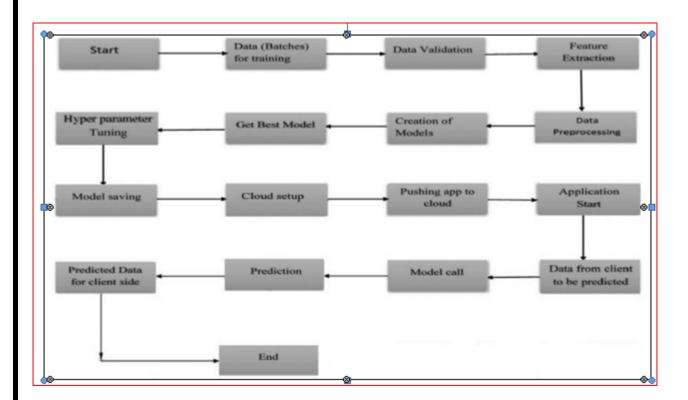

Fig)Data flow diagram

# 8.Testing

### 8.1 Test Cases

### **RESULTS:**

#### **a.** Performance Metrics

### i. Accuracy

The accuracy metric is one of the simplest Classification metrics to implement, and it can be determined as the number of correct predictions to the total number of predictions.

### ii. Confusion Matrix

A confusion matrix is a tabular representation of prediction outcomes of any binary classifier, which is used to describe the performance of the classification model on a set of test data when true values are known. The confusion matrix is simple to implement, but the terminologies used in this matrix might be confusing for beginners.

### 10.ADVANTAGES & DISADVANTAGES

### **Advantages:**

- This system can be used by many E-commerce Websites in order to have good customer relationship.
- User can make online payment securely.
- Data mining algorithm used in this system provides better performance as compared to other traditional classifications algorithms.
- With the help of this system user can also purchase products online without any hesitation.

### **Disadvantages:**

- If Internet connection fails, this system won't work.
- All e-banking websites related data will be stored in one place.
- System will match the review with those keywords which are in database rest of the words are not considered by the system.

### 11. CONCLUSION

The most important way to protect the user from phishing attack is the education awareness. Internet user must be aware of all the security tips which are given by experts. Every user must be trained to blindly follow the links to the websites where they have to send their sensitive information. It is essential to check the URL before entering the websites.

Here we have proposed a Random Forest Classification algorithm to predict the phishing

website based on their features. User can enter any URL to predict whether the website is phishing website or not.

Our proposed system has the accuracy of 93%. As we have implemented this algorithm by considering the URL and Domain Identity criteria, there are different criteria needs to work in future and to have an accuracy of 100%

#### 12. FUTURE SCOPE

Today most of the banking happens while you are sipping coffee or taking an important call. ATMs are at your doorstep. Banking services are accessible 24x7. There are more plastic cards in your wallet than currency notes. A huge part of this change is due to advent of IT. Banks today operate in a highly globalized, liberalized, privatized and a competitive environment. In order to survive in this environment banks have to use IT. Indian banking industry has witnessed a tremendous developments due to sweeping changes that are taking place in the information technology. This work involves descriptive research design as my project is questionnaire based. Descriptive research includes survey and fact-finding enquiries kinds. The major purpose of descriptive research is description of the state of affairs, as it exists at present. For this study the sample size is 50 people of the area New Delhi, who were using the E-Banking services.

### Sample output of the dataset rows:

	index	having_IPhaving_IP_Address	URLURL_Length	Shortining_Service	having_At_Symbol	double_slash_redirecting	Prefix_Suffix	having_Sub_
0	1	-1	1	1	1	-1	-1	
1	2	1	1	1	1	1	-1	
2	3	1	a	1	1	1	-1	
3	4	1	0	1	1	1	-1	

Figure 3: Sample output of the dataset

### **Handling Null Values**

```
#Analysing the data using pandas and Checking if the dataset contains any Null values.
ds.info()
ds.isnull().any() #no nullvalues
```

Figure 4: Handling null values

### Identifying Independent & dependent variables:

Figure5: Identifying Independent & dependent variables

Splitting the data:
